Canadian Technical Report of Fisheries and Aquatic Sciences

Technical reports contain scientific and technical information that contributes to existing knowledge but which is not normally appropriate for primary literature. Technical reports are directed primarily toward a worldwide audience and have an international distribution. No restriction is placed on subject matter and the series reflects the broad interests and policies of Fisheries and Oceans Canada, namely, fisheries and aquatic sciences.

Technical reports may be cited as full publications. The correct citation appears above the abstract of each report. Each report is abstracted in the data base *Aquatic Sciences and Fisheries Abstracts*.

Technical reports are produced regionally but are numbered nationally. Requests for individual reports will be filled by the issuing establishment listed on the front cover and title page.

Numbers 1-456 in this series were issued as Technical Reports of the Fisheries Research Board of Canada. Numbers 457-714 were issued as Department of the Environment, Fisheries and Marine Service, Research and Development Directorate Technical Reports. Numbers 715-924 were issued as Department of Fisheries and Environment, Fisheries and Marine Service Technical Reports. The current series name was changed with report number 925.

Rapport technique canadien des sciences halieutiques et aquatiques

Les rapports techniques contiennent des renseignements scientifiques et techniques qui constituent une contribution aux connaissances actuelles, mais qui ne sont pas normalement appropriés pour la publication dans un journal scientifique. Les rapports techniques sont destinés essentiellement à un public international et ils sont distribués à cet échelon. Il n'y a aucune restriction quant au sujet; de fait, la série reflète la vaste gamme des intérêts et des politiques de Pêches et Océans Canada, c'est-à-dire les sciences halieutiques et aquatiques.

Les rapports techniques peuvent être cités comme des publications à part entière. Le titre exact figure au-dessus du résumé de chaque rapport. Les rapports techniques sont résumés dans la base de données *Résumés des sciences aquatiques et halieutiques*.

Les rapports techniques sont produits à l'échelon régional, mais numérotés à l'échelon national. Les demandes de rapports seront satisfaites par l'établissement auteur dont le nom figure sur la couverture et la page du titre.

Les numéros 1 à 456 de cette série ont été publiés à titre de Rapports techniques de l'Office des recherches sur les pêcheries du Canada. Les numéros 457 à 714 sont parus à titre de Rapports techniques de la Direction générale de la recherche et du développement, Service des pêches et de la mer, ministère de l'Environnement. Les numéros 715 à 924 ont été publiés à titre de Rapports techniques du Service des pêches et de la mer, ministère des Pêches et de l'Environnement. Le nom actuel de la série a été établi lors de la parution du numéro 925.

ABSTRACT

The Canada/Greenland Joint Commission on the Management and Conservation of Narwhal and Beluga (JCNB) and the North Atlantic Marine Mammal Commission, with the participation of Fisheries and Oceans Canada Science, has developed a harvest allocation model for narwhal stocks shared between Canada and Greenland. For the model to be used successfully, information on catches from the communities by season that hunt narwhal from the shared stocks is needed. Catch statistics from 1970-2015 for 13 Canadian communities that hunt narwhals from the Baffin Bay population are reviewed. Detailed statistics by community are missing from some of the communities, particularly before quotas were implemented in 1977. In these cases, an average value calculated from reported hunts in the following 10 years is used as approximation. Many catches were reported with date of kill which allowed a separation of hunt statistics across seasons. When date of kill was not reported, as with total catch, we averaged catches over the next 10 years to estimate catch by season. The JCNB has identified six hunting regions in Canada where hunting occurs throughout the season and may include narwhals from a resident summer stock (in summer) or migrating narwhals from non-resident stocks in other seasons. Catches were attributed to these six hunting regions for use in the harvest allocation model. Struck and loss factors were applied to different hunting regions by period (1979-1989, 1990-2004, and 2005-2015). For 1979-

1989 two communities reported by hunt type and their struck and loss factors were used for their respective hunting regions by season, while averages were used for the other four hunting regions by season. For the latter two time periods, four and three communities reported respectively, but not by hunt type. In these cases their struck and loss factors were used for their respective hunting regions for all hunting seasons, and averages were used for other regions.

SOMMAIRE

La Commission mixte Canada-Groenland sur la conservation et la gestion du narval et du béluga et la North Atlantic Marine Mammal Commission, avec la participation du Secteur des sciences de Pêches et Océans Canada, a développé un modèle de répartition des captures pour les stocks de narvals partagés entre le Canada et le Groenland. Pour que le modèle soit utilisé avec succès, nous avons besoin de renseignements par saison sur les collectivités qui chassent le narval parmi les stocks partagés. Les statistiques sur les prises de 1970 à 2015 pour 13 collectivités canadiennes qui chassent le narval dans la population de la baie de Baffin sont en cours d'examen. Des statistiques détaillées manquent pour certaines collectivités, particulièrement pour ce qui est de la période précédant la mise en œuvre de quotas en 1977. Dans ces cas, une valeur moyenne calculée à partir des captures déclarées dans les 10 années suivantes est utilisée à titre approximatif. Plusieurs prises avaient été déclarées en indiquant une date de mise à mort, ce qui a permis de répartir les statistiques de chasse par saison. Quand aucune date de mise à mort n'était déclarée, comme pour le total de prises, nous avons effectué une moyenne des 10 années suivantes pour obtenir une estimation des prises par saison. La Commission mixte Canada-Groenland sur la conservation et la gestion du narval et du béluga a cerné six régions de chasse au Canada où la chasse a lieu pendant toute la saison et pourrait

toucher des narvals de stock résident en été comme des narvals en migration de stock non résident durant les autres saisons. Les prises ont été attribuées à ces six régions de chasse afin d'être utilisées dans le modèle de répartition des captures. Des facteurs d'abattage et de perte ont été appliqués à différentes régions de chasse par période (de 1979 à 1989, de 1990 à 2004 et de 2005 à 2015). Pour la période de 1979 à 1989, deux collectivités ont effectué leurs déclarations par type de chasse. Leur taux d'abattage et de perte a été utilisé pour leur région de chasse respective par saison, alors que des moyennes ont été utilisées pour les quatre autres régions de chasse par saison. Pour les deux périodes les plus récentes, quatre et trois collectivités respectivement avaient effectué des déclarations, mais pas par type de chasse. Dans ces cas, leur taux d'abattage et de perte a été utilisé pour leur région de chasse respective pour toutes les saisons, et des moyennes ont été utilisées pour les autres régions.

INTRODUCTION

Narwhals are part of the annual subsistence hunt in Nunavut, Canada. In order to ensure hunting is sustainable, it is important to understand the number of narwhals hunted annually. Fisheries and Oceans Canada, the regulating body for fisheries in Canada, did not require narwhal catches to be reported prior to 1971. In 1971 the Narwhal Protection Regulations were implemented and annual quotas were set for individual hunters (DFO 2013). In 1977 this was replaced by community specific quotas and in 1993 the Marine Mammal Regulations were enacted by the Government of Canada, which required a license or tag to be issued for each hunted narwhal (DFO 2013). In 1999 a community based management initiative was started by the Nunavut Wildlife Management Board, and although the stand-alone program was discontinued in 2009 the harvest limits and quota flexibility whereby communities could request approval to carry-over or borrow against their annual harvest limits, was still retained (DFO 2013). In the 2014-2015 harvest season an interim flex-quota system was implemented for narwhal after scientific modelling showed that quota flexibility would not impact the sustainability of the narwhal harvest. This system provides for a "flexible" quota system whereby communities can carry-over their unused narwhal tags for narwhal harvesting in the next harvest year without requesting approval on a yearly basis (Richard and Young 2015).

Currently narwhals from the Baffin Bay population are hunted by Inuit in both Canada and Greenland. The Canada/Greenland Joint Commission on the Management and Conservation of Narwhal and Beluga (JCNB) and the North Atlantic Marine Mammal Commission, with the participation of Fisheries and Oceans Canada Science,

has developed a two-step model (a stock exchange model and a population dynamics model) that combines expert opinion, catch statistics, telemetry data (satellite tagging), and abundance information since 1970 from both Greenland and Canada to allocate catches to different stocks (stock exchange model) and to analyze the impact of these catches on the dynamics of the eight narwhal stocks (population dynamics model) (Watt et al. 2018). These models work together to define stock catch levels for all stocks that meet management objectives. However, for the model to be used successfully, information on catches from the communities by season that hunt narwhal from the shared stocks is needed. This compilation combines harvest data obtained from Fisheries and Oceans Resource Management and published sources to provide a catch table for narwhal hunted in different communities, seasons, and hunting regions in Canada.

METHODS AND RESULTS

RAW CATCH STATISTICS

This compilation relies on information from a number of published resources that report community specific landings for each year (Mansfield et al. 1975, Mitchell and Reeves 1981, Strong 1989, DFO 1991, 1992a, b, 1993, 1994, 1995, 1996, 1997, 1999, Stewart 2007, Doniol-Valcroze 2014, Hall et al. 2015). For some years, particularly from 1970-1977 before community specific quotas were in place, there is often no record of the number of landed animals (Table 1). This is also the case for 4 records after 1977; for Qikiqtarjuaq in 1980 and 1981, for Hall Beach in 1995, and for Arctic Bay in 2000 (Table 1).

In some cases there were discrepancies among the published reports for the landed catches of narwhals. In these cases a note has been made in Table 1 and a justification for which number was considered more reliable is provided. Humane harvests of narwhal from entrapment events in Igloolik in 1979, and Pond Inlet in 2008 and 2015 (Watt and Ferguson 2011, Watt et al. 2018b) are not included in the catch statistics, but are indicated as a footnote for Table 1.

ESTIMATED CATCH STATISTICS

For the purposes of the two-step allocation model, at a minimum, an estimate of the number of catches from Canadian communities back to 1970 is required as input into the model. However, in some years for some communities catches were not reported (see Table 1). Rather than assuming these values are 0, the average number of catches from the next 10 years is used as an estimate of the number of narwhal landed in years when there is no record (Table 2). This calculation was applied to the data starting with the most recent year with missing data and moving back in time to 1970. For instance, for landed catches in 1971 for Arctic Bay an average of all catches from 1972-1981 is used. Then for catches in 1970 the average of catches from 1971-1980 is calculated, using the previously assigned value for 1971 (Table 2). Although this method can only provide a rough estimate, it is a better proxy than assigning values of 0 for years when hunts were not reported.

HUNTING SEASONS

Narwhal are hunted primarily in spring, summer, and fall throughout communities in Canada whereas in west Greenland a winter hunt of the Baffin Bay population also occurs (Heide-Jørgensen et al. 2013). To determine the proportion of animals hunted

from any specific stock, dates for the catches from each community are needed to determine if the communities are hunting whales from a defined summer stock, or migrating whales, which could be a part of the resident summer stock or from other summer stocks that are traveling between their summering and wintering grounds. Seasons were defined based on movements of narwhals into and out of their summering areas, and residence time on the summering grounds from satellite tag data (Watt et al. 2012, Heide-Jørgensen et al. 2013). Narwhals, particularly those from the Eclipse Sound and Admiralty Inlet stocks, begin making movements between summering areas in late August (Watt et al. 2012). As a result, seasons were defined as spring: Julian days 91-204 (1 April – 23 July), summer: Julian days 205-236 (24 July – 24 August to represent the residency time of narwhals in the summering region), fall: Julian days 237-334 (25 August – 30 November), and winter: Julian days 335-365 and 1-90 (1 December – 31 March).

Dates for community catches are provided for some years, but in many years not all catches have a date reported, and in some cases no dates are reported for any of the catches (Table 3; Appendix A). For years where dates were reported, the percentage of whales hunted in each season for each community for each year was calculated (Table 4; Appendix A). In years where no dates were reported but a hunt occurred, the hunt was divided among seasons by multiplying by the average percent of whales hunted in each season for that community for the next 10 years (Table 5). This was the case for all communities except Grise Fiord, which had too many recorded harvests of 0 (which provide no information about the seasonal hunt of narwhals). In this case, the hunt for Grise Fiord was divided among seasons by multiplying by the

average percent of whales hunted in each season for all years where there was a recorded hunt (2007, 2009-2011, and 2015). These percentages were then used to break down the catch statistics for each community, for each year, into seasons (Table 6).

For assigning catches to different narwhal stocks, hunting regions were identified for Canada (Figure 1). These regions are areas where hunting occurs, and in the summer may correspond to the individual narwhal stocks; however, outside the summer season hunts still occur within the hunting regions and at this time the hunts may include migrating narwhals from other stocks. As a result, catches are provided for the different seasons for each hunting region in Canada (Table 7). The communities of Clyde River and Qikiqtarjuak contribute to hunts in the Baffin Island Central region,

Figure 1. Map of hunting locations for Baffin Bay narwhals in Canada (NAMMCO 2015).

Pangnirtung and Iqaluit contribute to hunts in the Baffin Island South region, and Kugaaruk, Hall Beach, Igloolik, Gjoa Haven, Resolute Bay, Creswell Bay, and Taloyoak contribute to hunts in the Central Canadian Arctic hunting region (Table 7).

STRUCK AND LOSS

Not all animals that are injured or shot are recovered and accounted for in the hunt numbers. As a result, a struck and loss rate is calculated to estimate the proportion of whales that are killed but not landed. In Canada, struck and loss rates have been recorded by researchers who visited Pond Inlet in 1982-1983 (Weaver and Walker 1988) and Arctic Bay in 1983-1989 (Roberge and Dunn 1990) (Table 8). In some Canadian communities with a community-based management system, killed-lost and wounded-lost narwhal numbers were documented by hunters between 1999 and 2004 (Richard 2008) and from 2005-2015 (DFO data on file). From the narwhal hunts where losses are reported, Richard (2008) calculated a hunting loss rate correction (LRC).

$LRC = HM / LC$ where

HM = the estimated total hunting mortality, or the sum of the landed catch and hunting loss

LC = Landed Catch

The estimated hunting loss was calculated as:

$HM = (HM_{min} + HM_{max})/2$ where

HM_{min} = number of animals landed plus the ones reported sunk and lost

$HM_{max} = HM_{min} +$ the number reported wounded and escaped

This HM estimate used by Richard (2008) assumes that half of the animals wounded and escaped later die from their injuries. This assumption was untested but

considered reasonable since whales with wound scars are later seen alive but dead whales have also washed up after a hunt suggesting some whales survive from their wounds while others perish (Richard 2008). A loss rate correction was then averaged for each community with an associated standard deviation (Richard 2008). Landed catches were those reported at the time the losses were reported and thus do not always match the finalized report of landed catches for that particular community and year listed in Table 1. Usually this is a result of losses being reported before the hunting season is over. Ideally a struck and loss factor would be applied to each catch that occurs through different hunting methods; unfortunately this information was not reported through the community based management system.

Independent researchers investigated struck and loss rates from the communities of Pond Inlet and Arctic Bay in the open water season, on the floe edge, and at the ice crack in the 1980s (Table 8)(Weaver and Walker 1988, Roberge and Dunn 1990). We calculated struck and loss rates based on the data collected by Weaver and Walker (1988) and Roberge and Dunn (1990) following Richard (2008) to make them comparable to those reported through the community based management system (Table 8). To use all collected data and to apply the best available struck and loss rate for different years, recognizing that hunting techniques and methods may vary across communities and over time, we applied struck and loss rates to each hunting region based on communities that had reported losses (Pond Inlet and Arctic Bay) for each type of hunt from 1970-1989 (Weaver and Walker 1988, Roberge and Dunn 1990) (Table 9). For hunting regions that had no communities report losses, we assumed hunting that occurred in the spring and winter was either a floe edge or ice crack hunt,

while hunting in the summer season was an open water hunt, and used an average of losses reported by Pond Inlet and Arctic Bay (Table 9). For 1990-2004 (Richard 2008), and 2005-2015 (DFO data on file) there was no information available on struck and loss rates for specific hunts, but rates were applied to each hunting region that had a community that reported struck and loss rates (Arctic Bay for AB hunting region, Pond Inlet for PI hunting region, Qikiqtarjuaq for Baffin Island Central, and Kugaaruk for Central Canadian Arctic), and for all other hunting region an average from the communities that did report was used (Table 9). Although this method of applying average struck and loss factors is not ideal given differences in hunting techniques among hunting regions and across seasons, it is currently the best method for attributing losses to areas for which no other information is available. Catches for each hunt region in Canada were then multiplied by the corresponding struck and loss factor for each year (Table 10).

CONCLUSION

Catch statistics rely on reports from hunters, both for the catch and for the date of kill. These statistics should be considered the most up to date and best current information from Canada. However, in some instances, tags are misplaced or unaccounted for, and as a result catches statistics are subject to change in the future as sometimes tags are returned or reported years later. Future updates are anticipated.

Over the past five decades the largest hunts for narwhal in Canada have occurred in Arctic Bay, Pond Inlet, and Qikiqtarjuaq. Reported catches in Qikiqtarjuaq, part of the Baffin Island Central hunting region, have generally increased over time, and catches in Kugaaruk, which is part of the Central Canadian Arctic hunting region, have also

increased in the last decade. A summary of narwhal hunt statistics can be used for data modelling to estimate sustainable quotas and provide management advice.

ACKNOWLEDGEMENTS

We thank the hunters in the communities across Canada for reporting their hunts and dates of kill. Also thanks to J. Young for providing the data to DFO Science for analysis.

* Indicates the number of reported dates of kill (Appendix A; provided by J. Young (DFO unpublished data)) was greater than the harvest reported by Strong (1989) and therefore the number of animals killed with a date provided was used as the reported harvest for that community, in that year.

^a Strong (1989) mistakenly listed this harvest in 1973 but it should have been listed in 1972 (confirmed in Stewart 2007).

^b Mansfield et al. (1975) and Mitchell and Reeves (1985) report a harvest of 20 whales, but Kemper (1980) and Strong (1989) report 15. A harvest of 20 whales is used.

^c Mitchell and Reeves (1981) reported reduced harvest numbers in 1977 for Arctic Bay (40), Clyde River (35), Pangnirtung (1), Pond Inlet (99), and Qikiqtarjuaq (10), but in all cases except Pond Inlet, these appear to be the numbers of harvested whales where kill dates were also provided (see Table 2), thus the larger reported numbers by Strong (1989) were used.

^e Mitchell and Reeves (1981) reported 26.

- ζ In 1979 an ice entrapment event near Igloolik resulted in a harvest of 108 narwhal, but this is not included in this table. In 2008 and 2015 there were ice entrapment events near Pond Inlet where narwhal were harvested (624 and 231 respectively) and these are not included in this table.
- η Strong (1989) says not reported but Stewart (2007) identifies a catch of 21 narwhals in 1979 in Qikiqtarjuaq thus a value of 21 is presented.
- θ 1 whale was reported as hunted in DFO (1999) but this whale actually came from Repulse Bay, thus a value of 0 is presented.
- μ Reported harvest was 33 narwhal; however, one tag was issued for a narwhal caught in seal net, thus we report a harvest of 34 narwhal.
- ι 3 is the reported harvest but one of these whales was actually hunted out of Qikiqtarjuaq, thus a value of 2 is indicated and the reported harvest of 90 animals from Qikiqtarjuaq was adjusted to 91.
- ^ Reported harvest for Kugaaruk was 64 and 63 for 2014 and 2015 respectively; however, two of the kill dates for tags reported in 2014 actually indicated a hunt in March of 2015 (Appendix A), thus the harvest was adjusted to 62 and 65 for 2014 and 2015 respectively.

Table 2. Calculated catch statistics for years with no reported narwhal landed. AB = Arctic Bay, CR = Clyde River, GH = Gjoa Haven, GF = Grise Fiord, HBI = Hall Beach and Igloodik, IQ = Iqaluit, KG = Kugaaruk, PG = Pangnirtung, PI = Pond Inlet, QK = Qikiqtarjuaq, RBCB = Resolute Bay and Creswell Bay, TY = Taloyoak.

^a Exact dates were provided for 215 whales, for one whale only the month the whale was hunted (June) was recorded.

For our seasonal definitions, all of June is included in a spring hunt (Appendix A) thus we indicate that dates are provided for all 216 harvested whales.

^b Four female harvested in the "summer time" is reported. Summer could be defined anywhere from July-September for some hunters, thus this information could not be used for seasonal definitions (Appendix A).

^c Two hunted whales have exact harvest dates indicated, but 5 others indicate a harvest in "late October". For our seasonal definitions, all of October is included in a fall hunt (Appendix A) thus we indicate that dates are provided for all 7 harvested whales.

Table 4. Seasonal breakdown of hunts (% of whales killed in each season) for narwhal kills where dates were reported. Seasons were defined as spring: Julian days 91-204 (1 April – 23 July), summer: Julian days 205-236 (24 July – 24 August), fall: Julian days 237-334 (25 August – 30 November), and winter: Julian days 335-365 and 1-90 (1 December – 31 March). AB = Arctic Bay, CR = Clyde River, GH = Gjoa Haven, GF = Grise Fiord, HBI = Hall Beach and Igloodik, IQ = Iqaluit, KG = Kugaaruk, PG = Pangnirtung, PI = Pond Inlet, QK = Qikiqtarjuaq, RBCB = Resolute Bay and Creswell Bay, TY = Taloyoak. Superscript F = fall, Sp = spring, S = summer, and W = winter. Nr indicates not reported and (.) indicates a hunt of zero narwhals that year.

Table 5. Seasonal breakdown of hunts (% of whales killed in each season) with years where data was not reported calculated by taking the average percent for each season for the next 10 years. Seasons were defined as spring: Julian days 91-204 (1 April – 23 July), summer: Julian days 205-236 (24 July – 24 August), fall: Julian days 237-334 (25 August – 30 November), and winter: Julian days 335-365 and 1-90 (1 December – 31 March). AB = Arctic Bay, CR = Clyde River, GH = Gjoa Haven, GF = Grise Fiord, HBI = Hall Beach and Igloolik, IQ = Iqaluit, KG = Kugaaruk, PG = Pangnirtung, PI = Pond Inlet, QK = Qikiqtarjuaq, RBCB = Resolute Bay and Creswell Bay, TY = Taloyoak. Superscript F = fall, Sp = spring, S = summer, and W = winter; (.) indicates a hunt of zero narwhal that year.

Table 6. Seasonal breakdown of harvest (# of narwhals). Seasons were defined as spring: Julian days 91-204 (1 April – 23 July), summer: Julian days 205-236 (24 July – 24 August), fall: Julian days 237-334 (25 August – 30 November), and winter: Julian days 335-365 and 1-90 (1 December – 31 March). AB = Arctic Bay, CR = Clyde River, GH = Gjoa Haven, GF = Grise Fiord, HBI = Hall Beach and Igloodik, IQ = Iqaluit, KG = Kugaaruk, PG = Pangnirtung, PI = Pond Inlet, QK = Qikiqtarjuaq, RBCB = Resolute Bay and Creswell Bay, TY = Taloyoak. Superscript F = fall, Sp = spring, S = summer, and W = winter.

Table 7. Seasonal breakdown of harvest (# of narwhals) for narwhal per hunting region in Canada per year. AB = Arctic Bay, GF = Grise Fiord, PI = Pond Inlet, CCA = Central Canadian Arctic (includes the communities of Kugaaruk, Hall Beach, Igloolik, Gjoa Haven, Resolute Bay, Creswell Bay, and Taloyoak), BIC = Baffin Island Central (includes the communities of Clyde River and Qikiqtarjuaq), BIS = Baffin Island Sound (includes the communities of Pangnirtung and Iqaluit). Superscript F = fall, Sp = spring, S = summer, and W = winter.

Table 9. Struck and loss rates used for each hunting region in Canada for three different time periods (1970-1989, 1990-2004, and 2005-2015). AB = Arctic Bay, GF = Grise Fiord, PI = Pond Inlet, CCA = Central Canadian Arctic (includes the communities of Kugaaruk, Hall Beach, Igloolik, Gjoa Haven, Resolute Bay, Creswell Bay, and Taloyoak), BIC = Baffin Island Central (includes the communities of Clyde River and Qikiqtarjuaq), BIS = Baffin Island Sound (includes the communities of Pangnirtung and Iqaluit).

Time Period	Hunting Region	S&L Rate	SD for S&L	Reference	Hunting Type
1970-1989	AB Fall	1.40	0.14	Roberge and Dunn (1990)	Open water for AB in 1983 and 1988
	AB Spring	1.83	0.62	Roberge and Dunn (1990)	Average of floe edge and ice crack for AB in 1983 and 1988
	AB Summer	1.40	0.14	Roberge and Dunn (1990)	Open water for AB in 1987-1989
	PI Fall	2.07	-	Weaver and Walker (1988)	Open water for PI in 1982-1983
	PI Spring	2.51	1.38	Weaver and Walker (1988)	Average of floe edge and ice crack for PI in 1982-1983
	PI Summer	2.07	-	Weaver and Walker (1988)	Open water for PI in 1982-1983
	All other hunting regions Fall	1.62	0.39	Weaver and Walker (1988), Roberge and Dunn (1990)	Average of open water in AB (1983 and 1988) and PI (1982-1983)
	All other hunting regions Spring	2.09	0.94	Weaver and Walker (1988), Roberge and Dunn (1990)	Average of floe edge and ice crack in AB (1987-1989) and PI (1982-1983)
	All other hunting regions Summer	1.62	0.39	Weaver and Walker (1988), Roberge and Dunn (1990)	Average of open water in AB (1983 and 1988) and PI (1982-1983)
	All other hunting regions Winter	2.09	0.94	Weaver and Walker (1988), Roberge and Dunn (1990)	Average of floe edge and ice crack in AB (1987-

					1989) and PI (1982-1983)
1990-2004	AB Fall, Spring, Summer	1.23	0.13	Richard (2008)	All hunt types for AB for 2001, 2003-2004
	PI Fall, Spring, Summer	1.23	0.16	Richard (2008)	All hunt types for PI from 1999-2002
	CCA Fall, Spring, Summer, Winter	1.29	0.17	Richard (2008)	All hunt types for KG for 2001 and 2003
	BIC Fall, Spring, Summer	1.36	0.20	Richard (2008)	All hunt types for QK for 1999-2002 and 2004
	GF Fall, Spring, Summer	1.29	0.16	Richard (2008)	All hunt types for PI, AB, QK, and KG from 1999-2004
	BIS Fall, Spring, Summer	1.29	0.16	Richard (2008)	All hunt types for PI, AB, QK, and KG from 1999-2004
2005-2015	AB Fall, Spring, Summer	1.35	0.26	NWMB CBM (DFO data on file)	All hunt types for AB for 2005-2010
	PI Fall, Spring, Summer	1.15	0.07	NWMB CBM (DFO data on file)	All hunt types for PI for 2005-2007 and 2010
	CCA Fall, Spring, Summer, Winter	1.09	0.02	NWMB CBM (DFO data on file)	All hunt types for KG for 2005-2007
	BIC Fall, Spring, Summer	1.23	0.21	NWMB CBM (DFO data on file)	All hunt types for AB, PI, and KG for 2005-2010
	GF Fall, Spring, Summer	1.23	0.21	NWMB CBM (DFO data on file)	All hunt types for AB, PI, and KG for 2005-2010
	BIS Fall, Spring, Summer	1.23	0.21	NWMB CBM (DFO data on file)	All hunt types for AB, PI, and KG for 2005-2010

Table 10. Seasonal harvest of narwhals multiplied by a struck and loss factor for each hunting region in Canada. AB = Arctic Bay, GF = Grise Fiord, PI = Pond Inlet, CCA = Central Canadian Arctic (includes the communities of Kugaaruk, Hall Beach, Igloolik, Gjoa Haven, Resolute Bay, Creswell Bay, and Taloyoak), BIC = Baffin Island Central (includes the communities of Clyde River and Qikiqtarjuaq), and BIS = Baffin Island Sound (includes the communities of Pangnirtung and Iqaluit). Superscript F = fall, Sp = spring, S = summer, and W = winter.

APPENDIX A

Kill dates by community for Canadian communities that share narwhal stocks with Greenland. The field reported sex of the hunted animals is also presented. Seasons were defined as spring: Julian days 91-204 (1 April – 23 July), summer: Julian days 205-236 (24 July – 24 August), fall: Julian days 237-334 (25 August – 30 November), and winter: Julian days 335-365 and 1-90 (1 December – 31 March). The total number of hunted animals within each season and the percentage of animals hunted in each season for each year there is data is presented at the end of the recorded kills for each community.

Community	Kill Year	Kill month	Kill Day	Sex	DoY	Season
